Question 10.5.2.8:
An AP consists of 50 terms of which 3rd term is 12
and the last term is 106. Find the 29th term.
Solution:

Parameter	Value	description
$x(2)$	12	Third term
$x(49)$	106	Last term
$x(0)$		First term
d		Common difference
$x(n)$	$[x(0) + nd]u(n)$	general term

TABLE I
INPUT PARAMETERS

$$x(2) = x(0) + 2d \qquad (1)$$
$$x(49) = x(0) + 49d \qquad (2)$$

By solving (1) and (2), we get

$$\implies d = 2 \qquad (3)$$
$$\implies x(0) = 8 \qquad (4)$$

From the table

$$x(n) = [x(0) + nd]u(n) \qquad (5)$$
$$\implies x(n) = (8 + 2n)u(n) \qquad (6)$$

Finding x(29)

$$x(28) = x(0) + 28(2) \qquad (7)$$
$$\implies x(28) = 64 \qquad (8)$$

Finding the Z-transform

Fig. 1. graph of the given AP

$$X(z) = \sum_{k=-\infty}^{\infty} x(n) \times u(n) \times z^{-n} \qquad (9)$$

$$= \sum_{k=0}^{\infty} x(n) \times z^{-n} \qquad (10)$$

$$\implies X(z) = \frac{8 - 6z^{-1}}{(1 - z^{-1})^2} \quad |z| > 1 \qquad (11)$$
